

AIA VOICE INSIGHTS

FROM CUSTOMER CONVERSATION TO AGENT ACTION

CAPTURE • ANALYSE • EQUIP

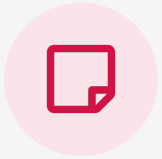

Every conversation, remembered.

AIA Voice Insights

Board briefing
AIA Global Innovation Conference

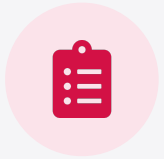

[Presenter name], [title]

The meeting ends. The real work begins

Notes

Typed up from memory

Fact-find

26 fields to complete

Record of advice

Written by hand

Follow-up

Often days later

CRM update

More typing

Planning assumption: about 45 minutes of admin per case. The pilot measures the real number.

What if the conversation was the work?

Capture

Dictate once, naturally, in English, Mandarin, Malay or Tamil.

Analyse

Eleven specialist agents build one picture of the customer, with sources.

Equip

Fact-find, record of advice and follow-up are drafted. The advisor signs off.

We took Juno out of the room

Before

- An AI host spoke to the customer
- First demo feedback: with the advisor in the room, customers prefer the advisor

Now

- Juno works for the advisor, after the meeting
- It listens, asks at most five short questions, reads back
- Only a person can start the analysis

We listened to the room. Then we changed the product.

Let me show you

Six minutes. Live.

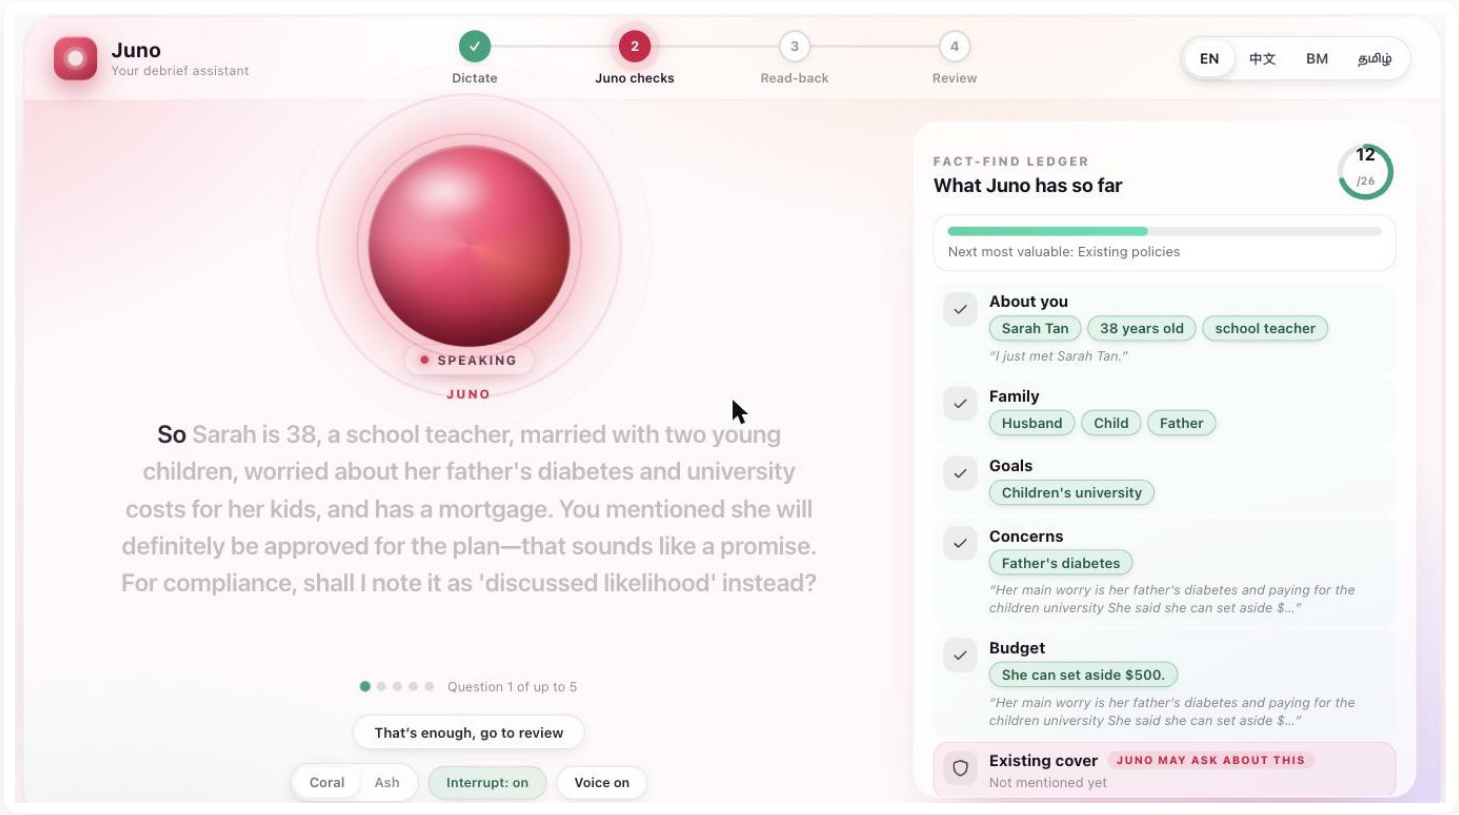

1. **Debrief with Juno**
   Talk. Juno asks only what is missing.

2. **Sign off**
   The advisor decides. Not the AI.

3. **One more thing**
   Practise the next meeting.

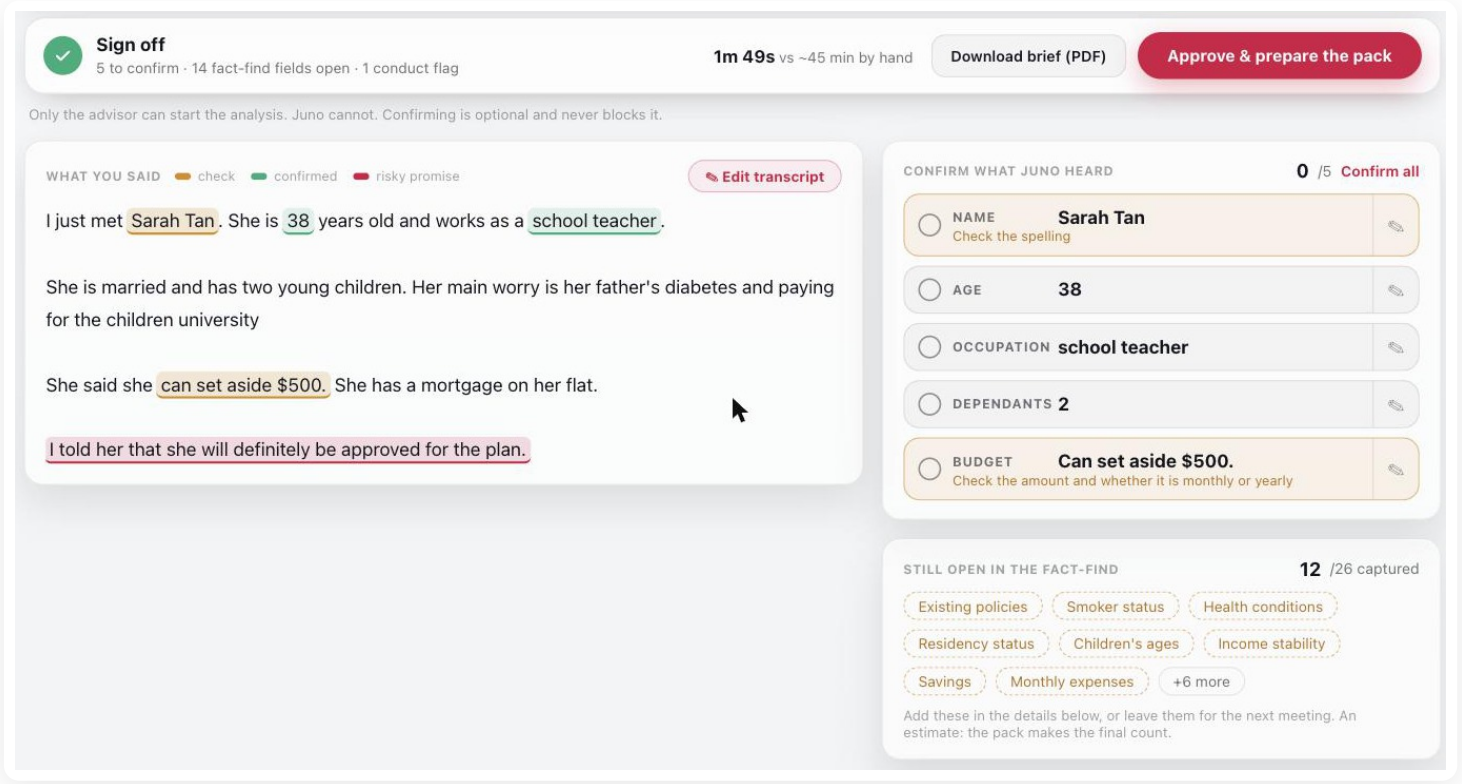

Juno listens, then asks only what is missing

- Every fact appears with the words it came from
- Juno catches a promise and offers a compliant way to record it
- At most five questions. Always skippable

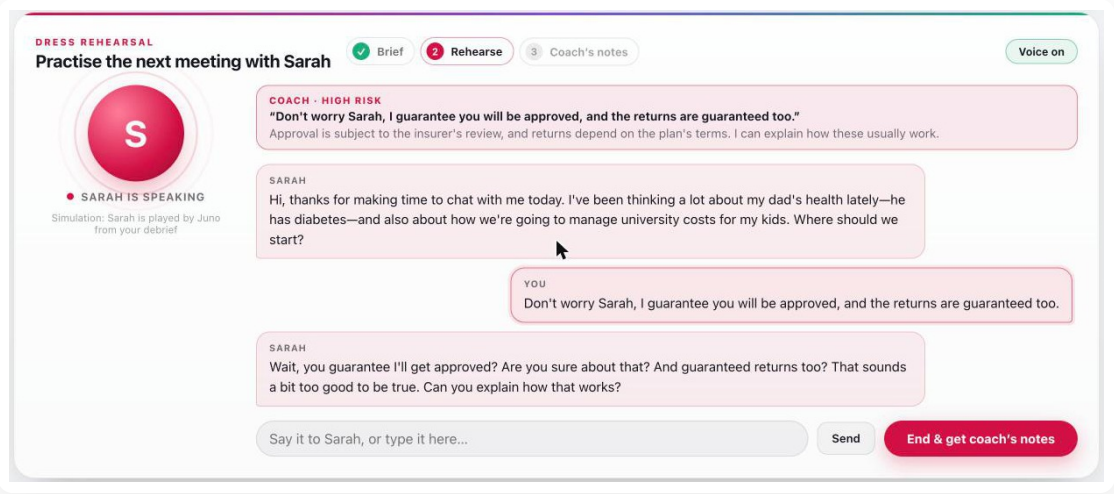

The advisor signs off. Not the AI

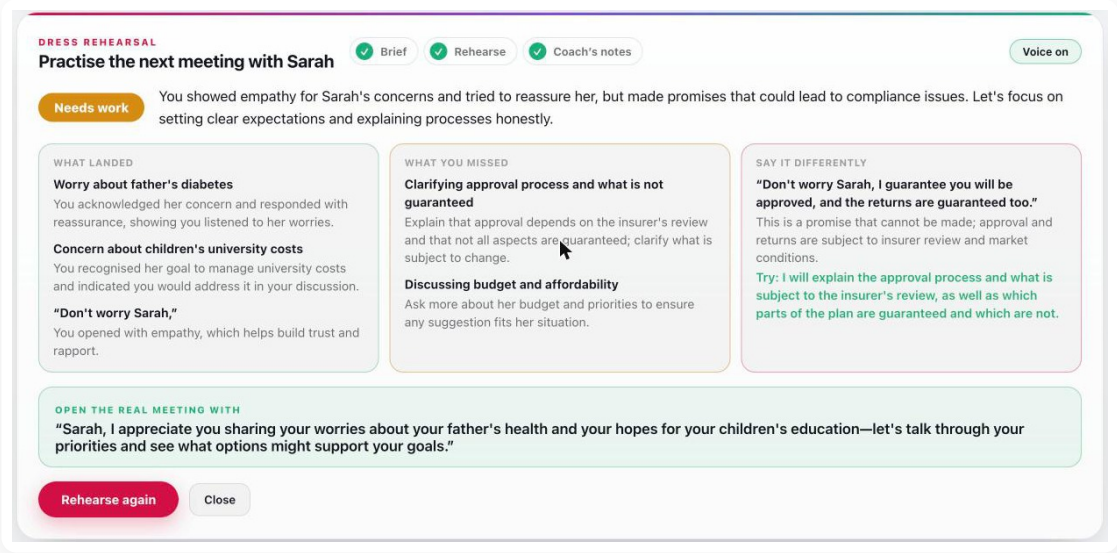

- Names, numbers and promises marked where they were said
- One tap to confirm or fix a fact
- One button starts the analysis. Only a person can press it

One more thing: practise before it counts

Juno plays the customer. A coach flags a risky promise the moment it is said.

Afterwards: what landed, what was missed, and what to say instead.

Training only: a simulation built from the debrief. Nothing is saved or sent.

The advisor decides. Always

Juno speaks only to the advisor
Never to the customer.

No prices, no returns, no products
It never quotes a figure or pushes a product.

"Suggest", never "recommend"
MAS wording. Relevance in words, not percentages.

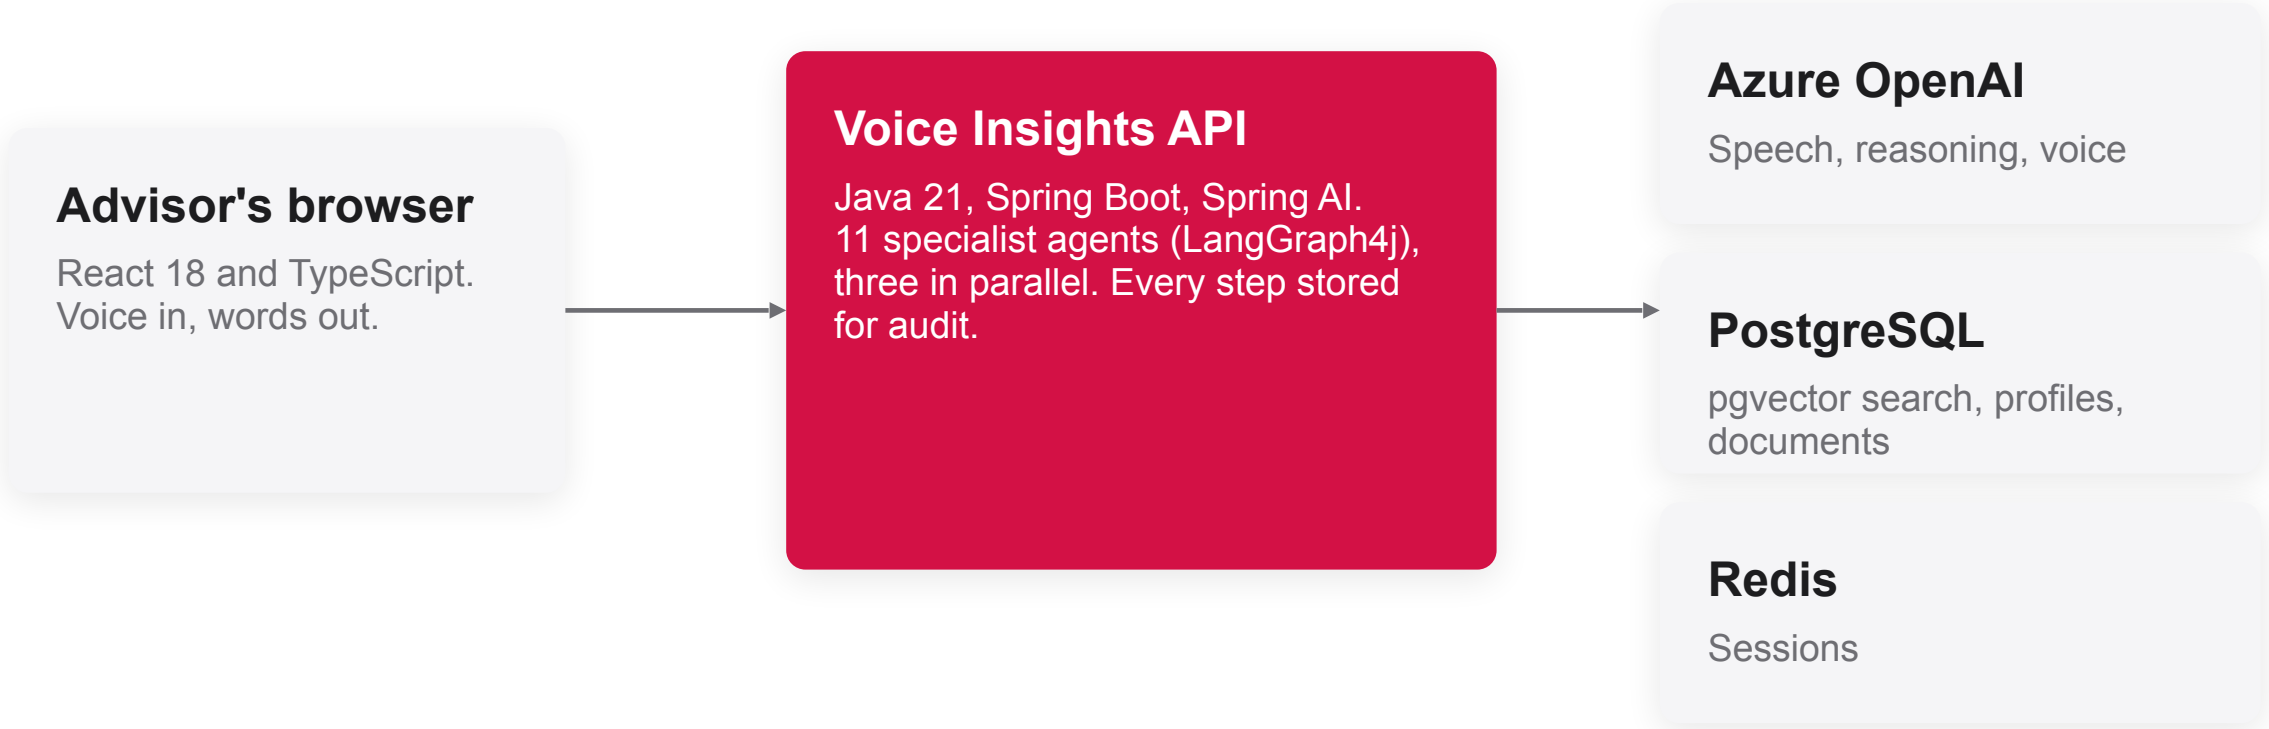

Only a person starts the analysis
The button ignores scripted clicks.

Every fact is confirmed on screen
Names and numbers are checked before use.

Nothing is sent automatically
Drafts only. ID and card numbers masked before storage.

Controls work in the prototype and are pilot-grade. Compliance, Security and Privacy review is part of the pilot.

Standard parts. No exotic bets

Containers on Azure Container Apps or AKS. Scales by adding capacity, not by redesign.

How we will know it works

≥ 50%

less time from meeting to documented advice

90%

of follow-ups sent within 24 hours

≥ 80%

fact-find completeness

100%

of advice packs signed off by an advisor

≥ 4 / 5

advisor satisfaction

< SGD 1

to run one conversation

Proposed pilot targets, to be agreed. The baseline is measured first, with the advisors who take part.

The numbers, honestly

If it works at scale (illustration)

200 advisors × 8 cases a month × 45 minutes

1,200

hours a month, about 7.5 full-time equivalents back with customers

An example, not a forecast. The pilot replaces each input with a measured one.

What it costs

SGD 0.35 – 0.60

to run one conversation (estimate)

SGD 240 – 350k

four-month proof-of-concept planning range, mostly team time

SGD 34 – 74k

extra cash if the team is existing AIA staff

Planning figures for Finance to confirm. Estimates use public list prices and move with AIA's Azure agreement.

Three decisions we need from you

1

Approve a controlled pilot

10 to 20 advisors, measured against a baseline

2

Name the owners

Compliance, Legal, Security and Data Privacy

3

Confirm the environment

The Azure region, and release the advisor group

Today

A working prototype

Pilot

Measure, review, harden

Next

CRM, more products and markets

The best technology disappears

The advisor shines.

Capture · Analyse · Equip

Appendix: risks and how they are handled

Risk	Level	How it is handled
Non-compliant output (a price, a guarantee)	Lower now	Juno speaks only to the advisor; scripted test pack; Compliance review before any pilot; every output reviewable
Personal data and consent (PDPA)	High	Privacy assessment, retention rules and advisor-side consent practice agreed with Data Privacy first
Names and accents misheard	Medium	Every fact confirmed on screen; native-speaker testing for Mandarin, Malay and Tamil
Slower than dictating	Medium	At most five questions, always skippable; the pilot compares both modes on time and completeness
Azure capacity or stalls at pilot load	Medium	Request quota early; automatic retries and a second attempt on slow calls; fallback voice
Advisors do not adopt it	Medium	Involve advisors from the start; measure time saved with them; the advisor stays the decision-maker

Appendix: where we are, exactly

Built and demonstrated

- Three ways to capture a conversation
- Juno debrief with the fact-find ledger
- Sign-off screen and follow-up drafts in four languages
- Dress Rehearsal
- 11-agent analysis and advice pack
- Admin dashboard

Tested so far

- Scripted spoken debriefs and rehearsals
- English, synthetic voice
- A prototype test, not a pilot
- Replies take a few seconds; slower in a noisy room

Not yet done

- Testing with real advisors
- Native-speaker review: Mandarin, Malay, Tamil
- Formal Compliance, Security and privacy review
- CRM write-back
- Measured time savings
- Load testing

Appendix: likely questions

Is this "advice" under MAS rules?

No. It produces suggestions for the advisor to review; the advisor decides. Compliance should still review it formally.

Can it make things up?

It is limited to the customer file and our product documents. Statements without a source are marked. A pilot-grade control.

What is the business value?

Not measured yet. I would not quote a number today. The pilot measures it.

Why not a general chatbot?

It is not tied to our customer file or product documents, shows no sources, and does not produce our paperwork.
